

Truespin

Scanner for log rotation monitoring

The real time monitoring

Truespin is a monitoring system for measuring the rotation of the logs.

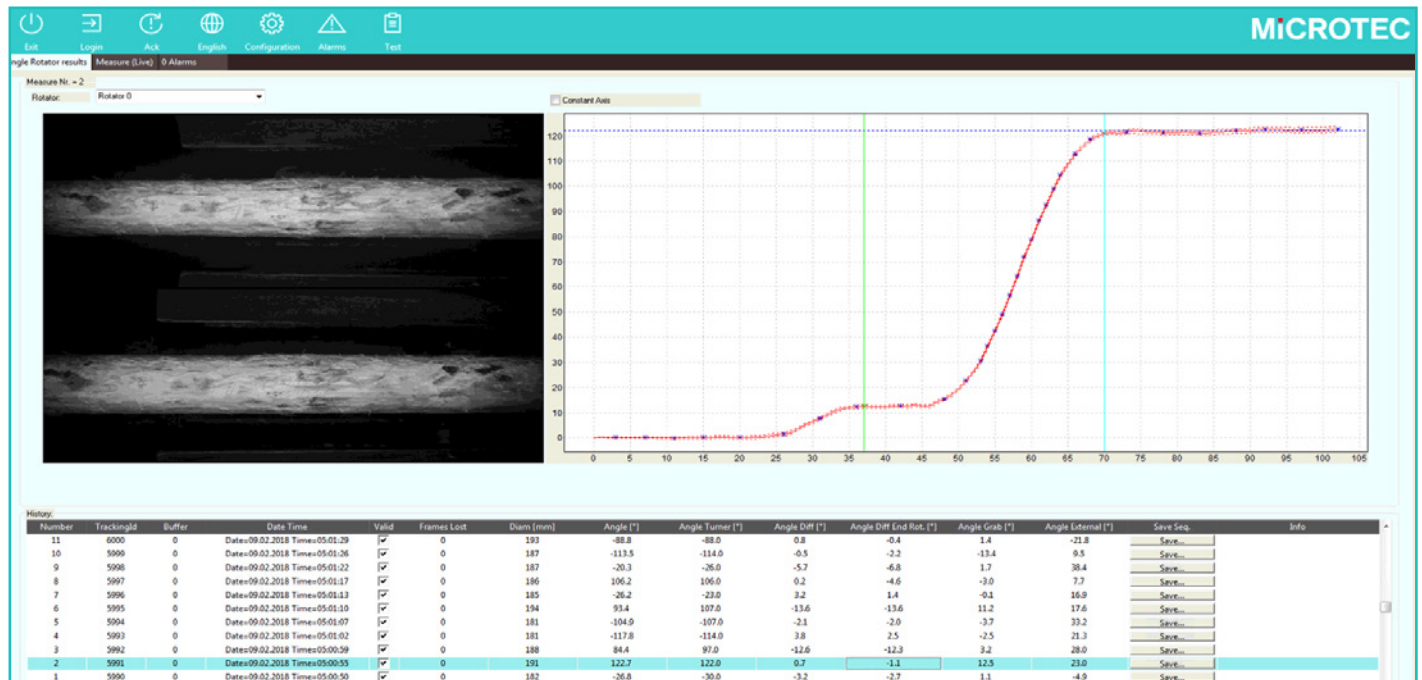

External texture detection and tracking

Truespin detects and tracks the external texture of the log acquired with digital cameras without the aid of additional marks.

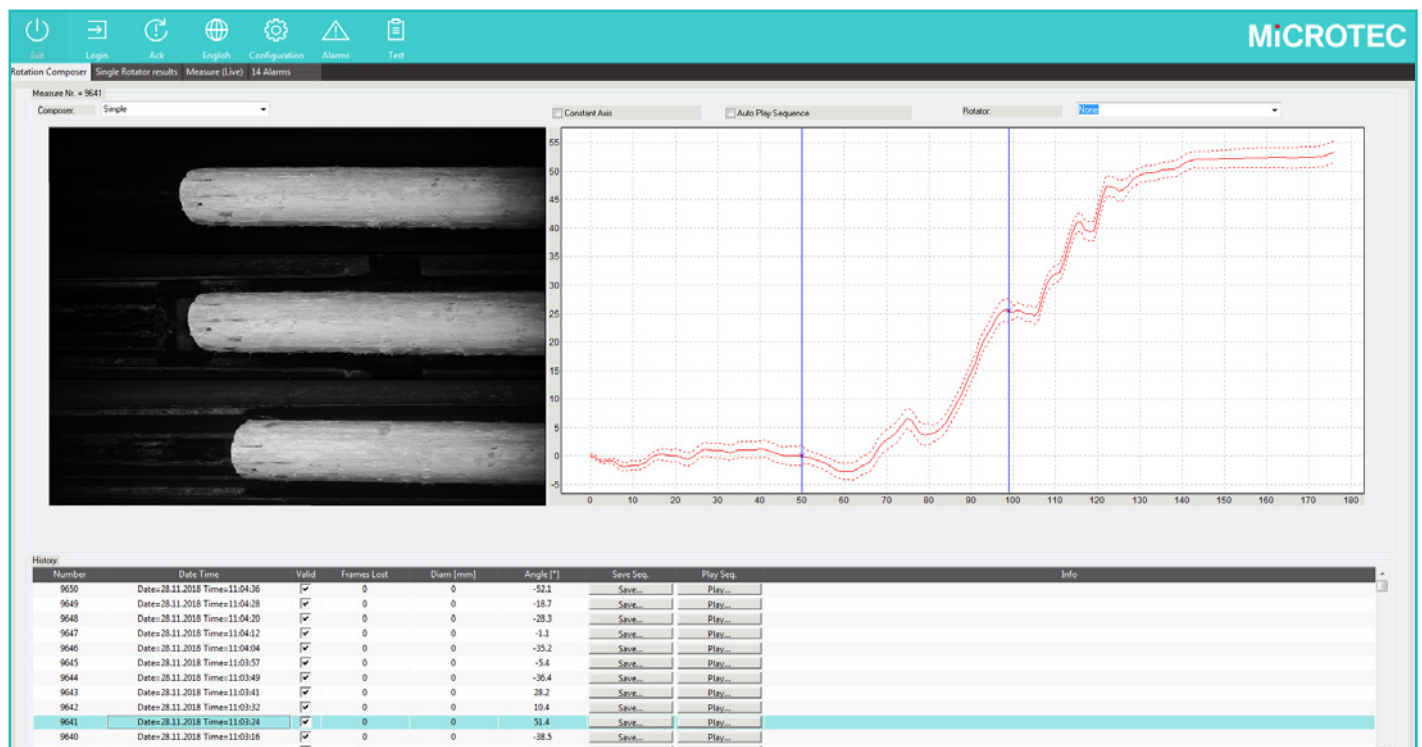

Log rotation monitoring during log clamping and turning

This system measures the rotation of the log during the clamping process and log turning in the log turner in front of the saw. Truespin provides reliable data about the actual log movements.

Log rotation monitoring on conveyors

Truespin allows to track the rotation of the log in areas where the conveying mechanics causes unintended movements. Installing several modules give the possibility to cover larger areas of the line.
